

Requirements Process

Turn an idea into clear requirements.

Work with AI to clarify what your assignment must include, do or satisfy, assess preparation before execution, and create a handoff others can use.

Your judgment guides the work. Describe your idea in your own words. Ask AI to research, brainstorm, debate alternatives and test assumptions. Challenge its proposals and redirect unhelpful questions. You decide what to accept.

See progress as it happens. Keep the dashboard open to see saved decisions, unresolved questions and the next step. Review proposed requirements with Keep / Change / Remove, then develop the specifications from Open to Confirmed. Readiness is assessed separately; Ready requires satisfied prerequisites and your acceptance.

Take a usable record with you. Export the dated PDF at any stage. The final handoff can organize next activities by responsible person, area and requirement, with unassigned work visible. Complex projects still need detailed budgeting, scheduling and project planning.

Use it for your assignment. Business initiatives, services, events, products and creative projects can all begin here. Specialist projects still need the relevant expertise.

Download and follow the complete setup guide:

ChatGPT plugin 0.2.0-alpha.4 requires Work and Sites/D1/MCP provisioning. Claude skill 0.3.0-alpha requires custom skills and Artifact/ArtifactData tools. Installation alone does not create a private workspace. Both are tested alphas; other-account and physical mobile support remain unverified.
